

Are network patch panels and network patch cords the same

Overview

A patch cable is a short Ethernet cable. Twisted-pair cables are used to make patch cables. There are two types of. Patch panels and cords are the key components among the several elements that help ensure your network performs reliably and efficiently. These components, which are usually overlooked, are critical for setting up, maintaining, and troubleshooting or resolving the issues of network connections. Their design, material, and compliance directly affect signal integrity, insertion loss, crosstalk, manageability, and fire safety. They come in a range of sizes, and are typically mountable, whether that's on a wall, or on a rack to make for easier. A patch panel provides a common termination point for all of the cables that will eventually connect to a common distribution device, such as a switch or router. An Ethernet patch panel consists of a method to permanently attach the solid copper cables that are part of the permanent infrastructure. However, the patch cable definition differs in that patch cords typically refer to non-networked applications, such as wiring audio components.
