

# Denmark fiber optic cable undergrounding

## Overview

In November 2024, two data cables in the Baltic Sea were damaged and the Chinese freight ship Yi Peng 3 was suspected of being the culprit by dragging its anchor along the seabed. Researchers at DTU hope to prevent sabotage on critical infrastructure by better detecting so-called dark ships—by using fibre-optic cables on the seabed. The Register of Underground Cable Owners (Ledningsejerregistret. dk) provides a single point. This visualization shows the growth of the undersea cable network, global internet peering capacity, and the distribution of IP addresses via BGP announcements over time. Use the controls at the top to play the animation or step through year by year. 2 meters (3-4 feet) deep to reduce the likelihood of accidentally being dug up. Project success depends on careful planning, precise installation practices, and proper consent and reduced risk of service supply loss through extreme weather.
