

# Electrical wires interfere with optical cables

## Overview

Electrical Interference: Electrical cables can produce electromagnetic interference (EMI) which can potentially disrupt the signal integrity of fiber optic cables, although fiber optics are inherently resistant to EMI, the components at either end may not be. This is due to several potential risks and complications that can arise from such an arrangement. In this article, we will explore whether there is interference. Isn't wired fiber optic internet, which uses light to transmit large amounts of data at incredibly high speeds, supposed to be safer and healthier for everyone?

The issue is that fiber optic internet service does not only use light to transmit data. The high-speed fiber optic data must be converted. The optical fiber cable is for the TV/internet and the conduit is for a 120V split AC so. I don't think drilling a hole in the LB fitting was a smart move. Any concerns running one circuit of 14 gauge in the same conduit?

I think those rules only apply to. Running electrical and data cables in the same conduit might seem like a tidy, cost-effective idea but it often leads to signal interference, compliance issues, and expensive headaches down the line.
