

# Examine the end face of the fiber optic pigtail

## Overview

A Fiber End-Face Microscope is a handheld or benchtop inspection device used to visually examine the tip—or “end face”—of a fiber optic connector. These microscopes magnify the fiber's surface, helping technicians spot any contamination, chips, or alignment issues that could affect. They are the bridge between fiber optic cables in the field and the equipment or patch panels that manage them. By combining factory-installed connectors with spliced bare fiber, pigtails ensure that network installers can create fast, reliable, and cost-effective terminations. Without pigtails. □□ For purchasing, use the RP Photonics Buyer's Guide for fiber endface inspection. Fiber optics is generally quite. This increased deployment of optical fiber networks, and the need for reliable high bandwidth makes the simple task of checking and inspecting connector end-faces a crucial process that must not be neglected. Whether you work in high-speed data centers. Endface Inspection on Fiber Patch Cord or OTDR Fiber Launch Cord To view an endface on a fiber patch cord or an OTDR fiber launch cord, insert the ferrule of the fiber connector to be inspected into the probe tip on the FI-500 probe and press the AF (Auto Focus) button.
