

# Fiber Optic Cable Reeling and Reservation Techniques

## Overview

This Applications Engineering Note (AE Note) addresses common issues regarding cable pay-off during outside plant installations known as cable squirting, cable tangling during payoff, and reel storage. A check list is also provided to cover these plus other issues that are related to placing cable. Recommendations for Fiber Optic Cable Installation Where reels are supplied with protective material fitted over the cable, the protection should remain in place until the cable will be installed. During installation, all curvatures should be smooth. Type 412 fiber optic reeling cables represent a specialized category of industrial cables designed for demanding applications where continuous flexing and dynamic movement are required. Ensure that there is a pulling. The reel's structural components consist of two flanges, central drum, flange bolts, SmartReel™ test connector and horizontal wood slats (Figure 1) that keep the reel in alignment and protect the fiber cable from any damage that may occur during transporting and storage. Do not bend the cable more sharply than the minimum recommended bend radius.
