## Overview

An optical module usually consists of an optical transmitting device (TOSA, including a laser), an optical receiving device (ROSA, including a photodetector), functional circuits, main control circuit board (PCBA), housing and optical (electrical) interface and other. An optical module usually consists of an optical transmitting device (TOSA, including a laser), an optical receiving device (ROSA, including a photodetector), functional circuits, main control circuit board (PCBA), housing and optical (electrical) interface and other. Optical module printed circuit boards serve as the pivotal platform for achieving electro-optical signal conversion, occupying a crucial position within high-speed communications and data centre domains. Accompanying the rapid advancement of information technology, data transmission speeds and. As artificial intelligence, 5G infrastructure, and hyperscale data centers demand ever-faster data transmission, optical modules have become the bedrock of modern communication. The Printed Circuit Board (PCB) at the heart of these modules is no longer a simple substrate but a highly engineered. Combining electrical and optical layers in a single circuit board or chip can be a solution to all of these challenges. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. The optics module is comprised of Si photodiodes, optical components, and current-to-voltage conversion circuit. Our lineup includes filter type spectroscopic modules (C13398 series) specialized for signal detection of many known wavelengths, and spectroscopic modules with light sources (C16028. Optical module PCBs are essential for improving communication and data transmission speeds in many different industries, including telecommunications, data centers, and high-speed networks. They make long-distance optical signal transmission and reception easier, which speeds up and improves.
