

# No network access via the cable tray

## Overview

The most common causes of no network access include a faulty or disconnected Ethernet cable, a malfunctioning Wi-Fi adapter, incorrect network settings, and issues with the router or modem. Additionally, software conflicts, outdated drivers, and viruses can also cause network. This error typically occurs when your device is unable to connect to a network, whether it's a Wi-Fi network, a wired Ethernet connection, or a mobile data network. The error can be caused by a variety of factors, including:

Network connectivity issues: Problems with your internet service provider. My phone connected via wi-fy and my roku connected via ethernet wire/cable. I check my desktop win 10 computer (which remained on while the internet was out) but the network indicator in the system tray was a globe indicating no internet and hovering the mouse over the icon noted "no internet" Like. If after you upgrade or update your Windows 11/10 you notice that the Network Connectivity Status Indicator (NCSI) on the notification area/system tray on the right end of the Taskbar indicates no internet access, but you're able to connect to the internet and access websites in your browser, then. DNS, proxy, IPv6 and virtual adapters (VPN) often confuse connectivity detection. If it works via cable and not via Wi-Fi, point to the card/bands; a Wi-Fi USB helps confirm hardware. It enables devices like computers, printers, and gaming consoles to communicate with each other and access the internet.
