

OTDR optical cable connector loss

Overview

The OTDR measures distance and loss between the two markers. This can be used for measuring loss of a length of fiber, where the OTDR will calculate the attenuation coefficient of the fiber, or the loss of a connector or splice. Loss Quantification: Connector loss is determined by measuring the drop in signal power, expressed in decibels (dB), between designated points on the trace. Bidirectional Testing: Inspect launch cable connectors for dirt, damage or wrong connector type. Use an out-of-band test wavelength (1625 nm or 1650 nm) on a filtered port. Many OTDR's are capable of reporting optical return loss by having the functions described in this. An OLTS ensures the most accurate insertion loss measurement, but it can't pinpoint the exact location of the loss. Now an optical time domain reflectometer (OTDR) becomes your ultimate troubleshooting solution. However, like any measurement technique, OTDR.
