

# Power of Telecommunication Optical Splitter

## Overview

By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. In the backbone of modern Fiber-to-the-Home (FTTH) networks, optical splitters serve as the unsung heroes that enable cost-efficient connectivity for millions of subscribers. Splitters are most commonly factors of 2, such as 1x2, 1x4, 1x8, 1x16, 1x32. A fiber-optic splitter, also known as a beam splitter, is based on a quartz substrate of an integrated waveguide optical power distribution device, similar to a coaxial cable transmission system. Conversely, it can also combine multiple signals into one. Their ability to efficiently manage optical signals makes them indispensable in various. In a Passive Optical Network (PON), a single optical fiber carries massive amounts of data using light.
