

Secondary distribution box connected to secondary wiring box

Overview

An electrical sub panel, also known as a sub distribution board or sub circuit breaker panel, is a smaller secondary panel connected to the main electrical panel in a building. It serves as an extension of the main electrical panel to distribute power to different areas or circuits. The process of connecting a secondary breaker box, known as a subpanel, to an existing main electrical panel allows for the expansion of electrical capacity in a specific area, such as a garage, basement, or workshop. A subpanel is essentially a satellite distribution point that feeds power to. Primary distribution systems consist of feeders that deliver power from distribution substations to distribution transformers. Many feeders leave substation in a concrete ducts and are routed to a nearby pole.) is a cabinet or cutout box which contains on controlling and protective devices (such as circuit breakers, fuses, switches etc.) used to. Proper sub panel wiring is a fundamental skill for any licensed electrician, critical for safely expanding a building's electrical capacity.
