

Splitter connected to dual OLTs

Overview

To use this function you need a 2:N optical splitter, access to the local OLT and access to the remote OLT. This function is called Dual-homing, Two OLTs form a virtual device group, and each OLT has a downstream PON port that together forms a primary backup. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. We use the UF-OLT 8 for the LAG uplinks. Does the UFiber OLT work with the 2x32 splitters?

We'd like to add redundancy as the OLTs. Today's high-performance local area networks (LANs) deliver real-time services, ranging from typical voice, data, and video transmission for everyday business applications to an increasing range of building applications like surveillance, access control, LED lighting and building automation. PON (Passive Optical Network) refers to a fiber optic network built using a point-to-multipoint topology and fiber optic splitters.
