

# Temperature and humidity standards for hot aisles in data center computer rooms

## Overview

Therefore, in data centers, it is recommended to measure temperatures in aisles at various heights, as well as monitoring the top of the rack, where hot air tends to accumulate. Regarding relative humidity, the general recommendation for IT environments is in the range 45%-55% HR. Discover which range of guidelines is best for each equipment class. (light g power panel) since this may influence the selection of the power equipment in data center. Each piece of data center equipment—including enterprise servers, storage devices, switches, firewalls, and other appliances—has a recommended temperature and humidity range at which it operates most efficiently. However, you can't create individual climates for each piece of gear, because it all. Properly controlled cooling and humidity reduce incidents and save money. And if you build or use a PC at home, this is also relevant: there are clear differences between a desktop, a laptop, and a server rack, but thermal and HR principles apply to all of them.
