

What is the material of the small busbar copper rod

Overview

For most low-voltage busbar systems, the default busbar copper choice is Electrolytic Tough Pitch (ETP) copper, usually designated as UNS C11000 or Cu-ETP in EN standards. ETP copper typically contains at least 99. As a core component in busbar trunks and grounding systems, it directly carries large currents. Instead of relying on multiple cables, designers concentrate current into solid or laminated copper bars to achieve better control over impedance, clearances, and heat. Copper busbars are essential components in electrical systems, used to conduct electricity within switchboards and other apparatus. Both are high in. In electric power distribution, a busbar (also bus bar) is a metallic strip or bar, typically housed inside switchgear, panel boards, and busway enclosures for local high current power distribution, transmission, or switching substations.
